## Defined Contribution Plan Participants' Activities, First Half 2013

Sarah Holden, ICI Senior Director of Retirement and Investor Research, and Daniel Schrass, ICI Associate Economist, prepared this report.

#### **Key Findings**

DC plan withdrawal activity in the first half of 2013 remained low and was similar to the activity observed in the first half of 2012. In 2013:H1, 2.1 percent of DC plan participants took withdrawals, the same pace as in 2012:H1. Levels of hardship withdrawal activity also remained low. Only 0.9 percent of DC plan participants took hardship withdrawals during 2013:H1, the same share as in 2012:H1.

**The commitment to contribution activity in 2013:H1 continued at the high rate observed in 2012:H1.** Only 1.5 percent of DC plan participants stopped contributing in 2013:H1, compared with 1.6 percent during 2012:H1 and 1.6 percent during 2011:H1.

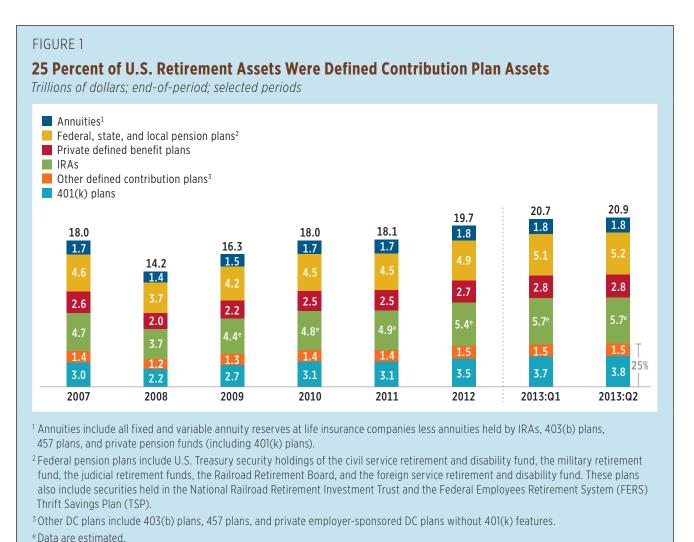

Most DC plan participants stayed the course with their asset allocations as stock values generally rose over the first six months of the year. In the first half of 2013, 7.4 percent of DC plan participants changed the asset allocation of their account balances and 6.0 percent changed the asset allocation of their contributions. These levels of reallocation activity were similar to the reallocation activity observed in the same time frame a year earlier.

**DC** plan participants' loan activity continues to remain elevated compared with five years ago. This pattern of activity also was observed in the wake of the bear market and recession earlier in the decade. At the end of June 2013, 18.1 percent of DC plan participants had loans outstanding, compared with 17.9 percent at the end of March 2013, 18.2 percent at year-end 2012, and 15.3 percent at year-end 2008.

#### Introduction

Note: Components may not add to the total because of rounding.

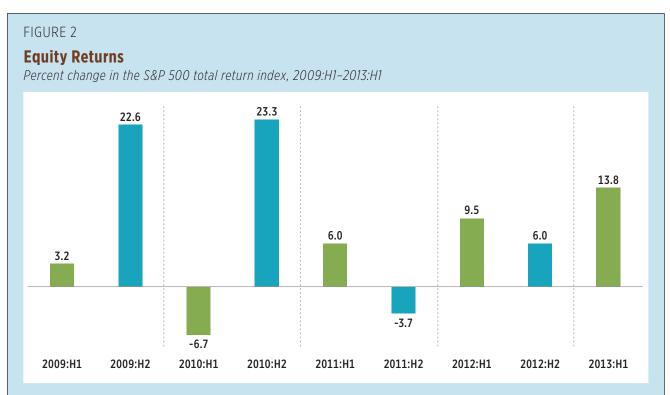

Defined contribution (DC) plan assets are a significant component of Americans' retirement assets, representing one-quarter of the total retirement market (Figure 1) and almost one-tenth of U.S. households' aggregate financial assets at the end of the second quarter of 2013.¹ To measure participant-directed changes in DC plans, ICI has been tracking participant activity through recordkeeper surveys since 2008. This report updates results from ICI's survey of a cross section of recordkeeping firms representing a broad range of DC plans and covering about 24 million

<sup>2</sup> 

employer-based DC retirement plan participant accounts as of June 2013. The broad scope of the recordkeeper survey provides valuable insights about recent withdrawal, contribution, asset allocation, and loan decisions of participants in these plans. The most recent survey covered DC plan participants' activities in the first six months of 2013,<sup>2</sup> with stock prices generally rising throughout this period (Figure 2). On net, the S&P 500 total return index was up 13.8 percent in 2013:H1.

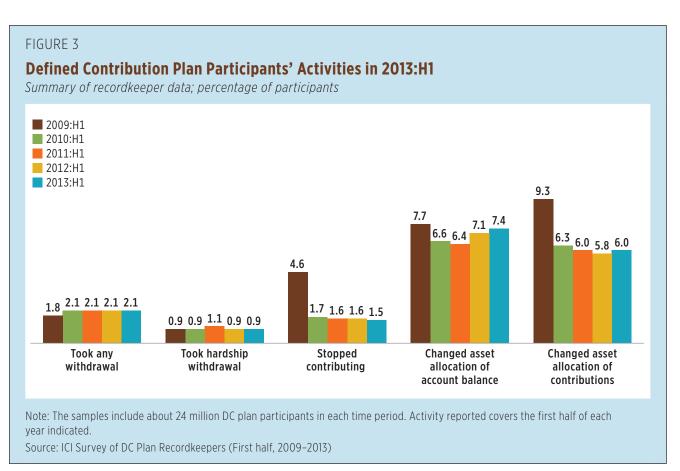

Note: The S&P 500 total return index consists of 500 U.S. stocks chosen for market size, liquidity, and industry group representation. Sources: Investment Company Institute, Bloomberg, and Standard & Poor's

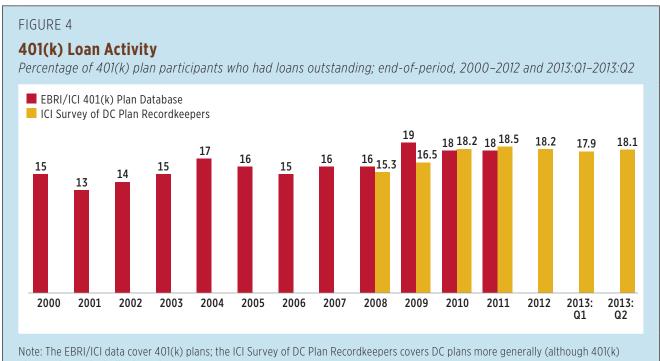

#### DC Plan Participants' Activities in 2013:H1

The withdrawal and contribution data indicate that essentially all DC plan participants continued to save in their retirement plans at work. DC plan participants' withdrawal activity during the first half of 2013 was in line with activity observed during the first half of the prior year, and a negligible share of participants stopped contributing during the first half of 2013.<sup>3</sup> In 2013:H1, 2.1 percent of DC plan participants took withdrawals from their DC plan accounts, with 0.9 percent taking hardship withdrawals (Figure 3).<sup>4</sup> These levels of activity are the same as those observed in the first half of 2012. In 2013:H1, only 1.5 percent of DC plan participants stopped contributing, compared with 1.6 percent in 2012:H1 and 1.6 percent in 2011:H1. It is possible that some of these participants stopped contributing simply because they had reached the annual contribution limit.

The survey of recordkeeping firms also gathered information about asset allocation changes in DC account balances or contributions. During the first six months of the year, 7.4 percent of DC plan participants had changed the asset allocation of their account balances, compared with 7.1 percent in 2012:H1 and 6.4 percent in 2011:H1 (Figure 3).<sup>5</sup> Reallocation activity regarding contributions was similar to rates observed in earlier periods; 6.0 percent of DC plan participants changed the asset allocation of their contributions in 2013:H1, compared with 5.8 percent in 2012:H1 and 6.0 percent in 2011:H1.

Loan activity remained about the same in 2013:Q2, after rising since the end of 2008 and throughout 2011.6 This pattern of activity is similar to that observed in the wake of the bear market and recession in the early 2000s (Figure 4).7 The sample of recordkeepers reported that as of June 2013, 18.1 percent of DC plan participants had loans outstanding, compared with 18.2 percent at year-end 2012, and 15.3 percent at year-end 2008.

plans make up the bulk of DC plans).

#### **Notes**

- <sup>1</sup> Total financial assets of U.S. households were \$61.9 trillion at the end of 2013:Q2. See U.S. Federal Reserve Board 2013. For total retirement market data, see Investment Company Institute 2013.
- This report presents withdrawal, contribution, and asset allocation activity during the first half of 2013 and compares the 2013:H1 rates of activity to 2012:H1, 2011:H1, 2010:H1, and 2009:H1. Caution should be exercised when comparing the results from the surveys for different periods. Data should only be compared for similar periods—evaluating periods that are similar in terms of length and timing during the year allows us to focus on the relevant variables. For example, if there are any effects that are typical for the beginning of the year (e.g., people getting bonuses to invest, profit-sharing contributions occurring in the first quarter, people reacting to upcoming taxes, people reacting to past holiday spending), then it is essential to compare periods that also may experience these "seasonal" effects. In addition to seasonal effects, DC plan participant activity may be influenced by cyclical factors (e.g., recent stock market returns). Because some participants may visit their asset allocations at the beginning of the year and not again, it is not possible to translate the year-to-date figures into an estimate of activity for the whole year. For annual activity through 2012, see Holden and Schrass 2013.
- The recordkeepers typically remove participants who are no longer working for the employer sponsoring the plan. It would not be correct to include such separated, retired, or terminated participants, because they cannot contribute. The goal of the survey is to measure the activity of active DC plan participants.
- <sup>4</sup> There are two possible types of withdrawals from DC plans: nonhardship and hardship. Generally, participants withdrawing after age 59½ are categorized as nonhardship withdrawals. A participant seeking a hardship withdrawal must demonstrate financial hardship and generally faces a 10 percent penalty on the taxable portion of the withdrawal. If a plan allows loans, participants are generally required to first take a loan before they are permitted to take a hardship withdrawal.
- Annual rates of account balance reallocation activity observed in the ICI Survey of DC Plan Recordkeepers for 2008–2012 are consistent with the behavior observed in earlier years in other data sources. Historically, recordkeepers find that in any given year, DC plan participants generally do not rebalance in their accounts (for references to this research, see note 80 in Holden, Brady, and Hadley 2006; and discussion of changes in asset allocation and note 32 in Holden et al. 2012).
- The EBRI/ICI 401(k) database update reports loan activity among 401(k) participants in plans that allow loans. At year-end 2011, 87 percent of participants in the database were in plans that offer loans; among those participants, 21 percent had loans outstanding at year-end 2011. This translates to 18 percent of all active 401(k) participants having loans outstanding. The year-end 2011 EBRI/ICI database includes statistical information about 24.0 million 401(k) participants in 64,141 plans, with \$1.415 trillion in assets. See Holden et al. 2012.
- <sup>7</sup> The National Bureau of Economic Research dates the recession in the early 2000s to have occurred between March 2001 and November 2001. The latest recession was dated to have occurred between December 2007 and June 2009. See National Bureau of Economic Research 2010.
